

Top-1 accuracy gain within each benchmark

Percentage-point change relative to the matched spectral baseline

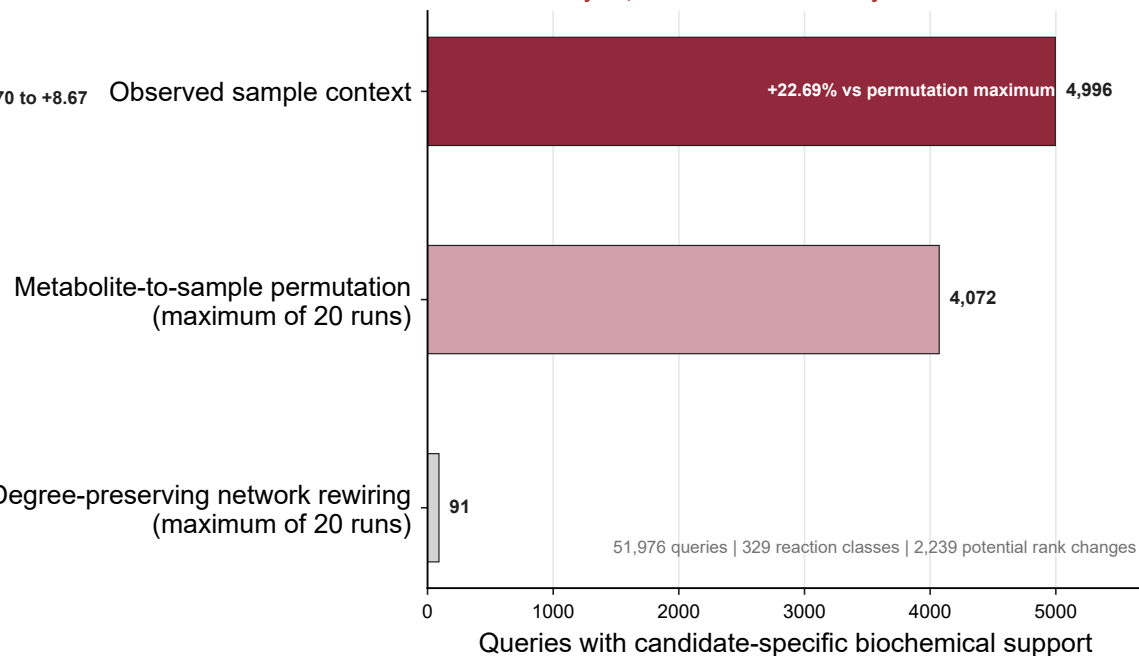

The six-source whisker shows the observed source range; the all-query whisker is a 95% formula-cluster CI.

Coverage- and degree-matched controls attenuated the static-network gain; independent MassBank transfer was not robust.

Candidate-specific biochemical support in real samples

Truth-blind event yield; not an annotation-accuracy estimate

Observed excess over the permutation maximum: +23.18% and +19.91% in the two studies.

The event-concentration gate was not met; structure truth remained unopened; annotation accuracy was not evaluated.
